

I'm bad with names and faces, which is difficult as a movie lover. There are a few actors/actresses that I love to see, but I needed a tool to help me remember which movies they're in and which movies overlapped between them. So I used Obsidian to make a linked graph of all the movies I've seen and the main actors in them. For the past year, I've been using Google and Letterboxed to try to remember every movie I've seen to represent them in this graph. It's also important to note that this is based on films that I have seen. There might be actors that have worked together on the same film, but that film isn't represented here because I personally have not seen it.

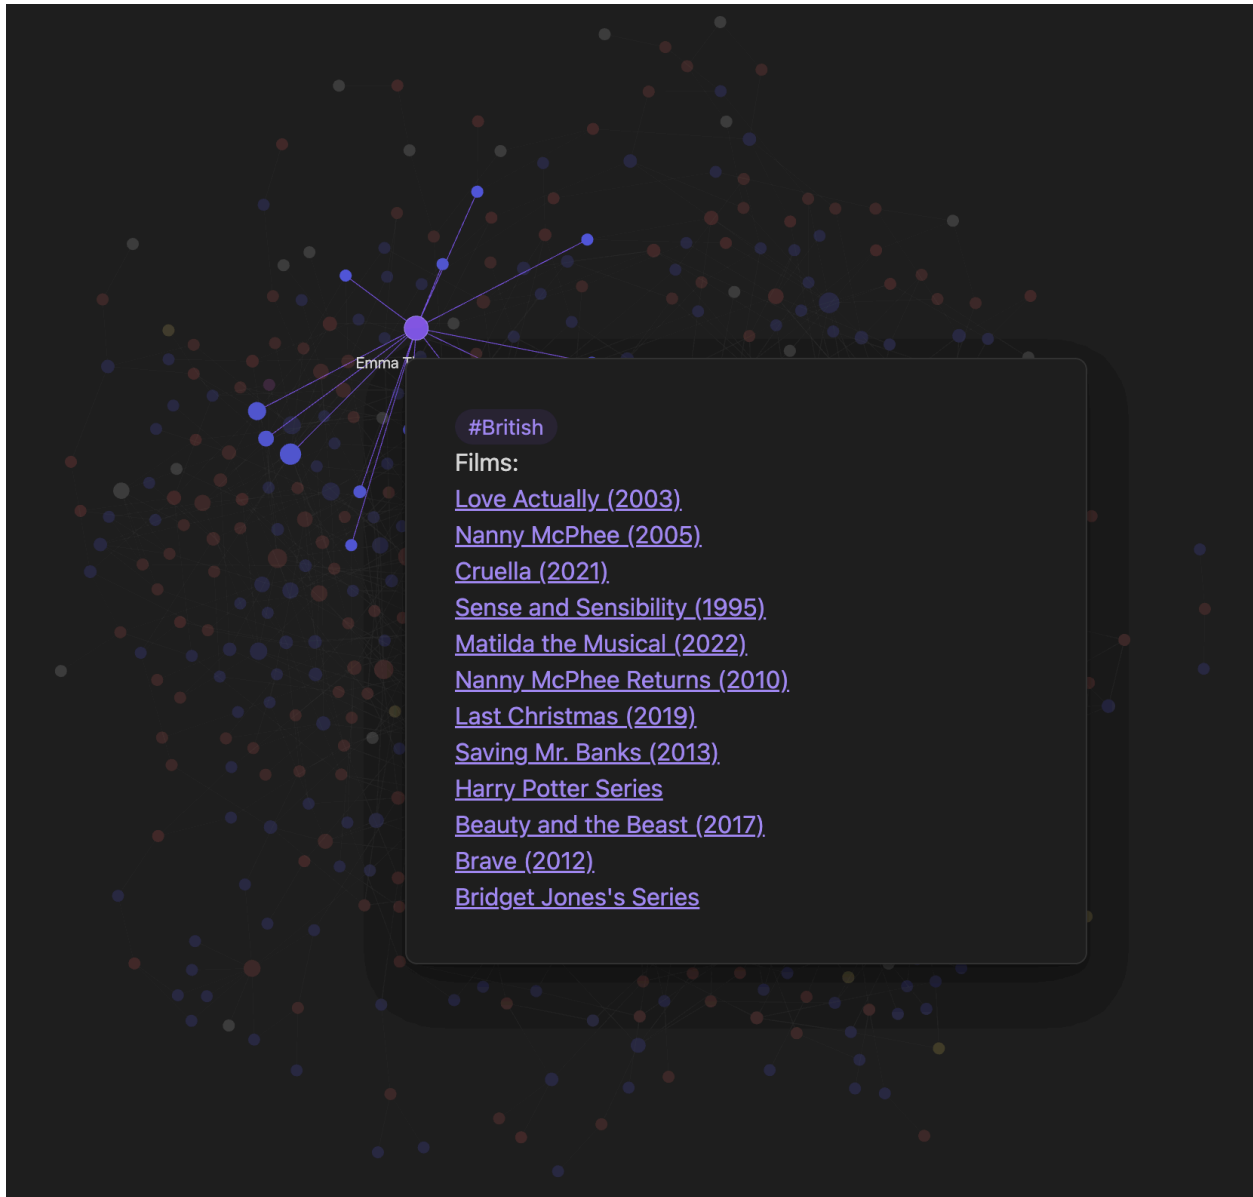

Each red node (vertex) indicates an actor, blue nodes are a film, and white nodes are a TV show. The link (edge) between a red and blue/white node is an actor in that film. A link between

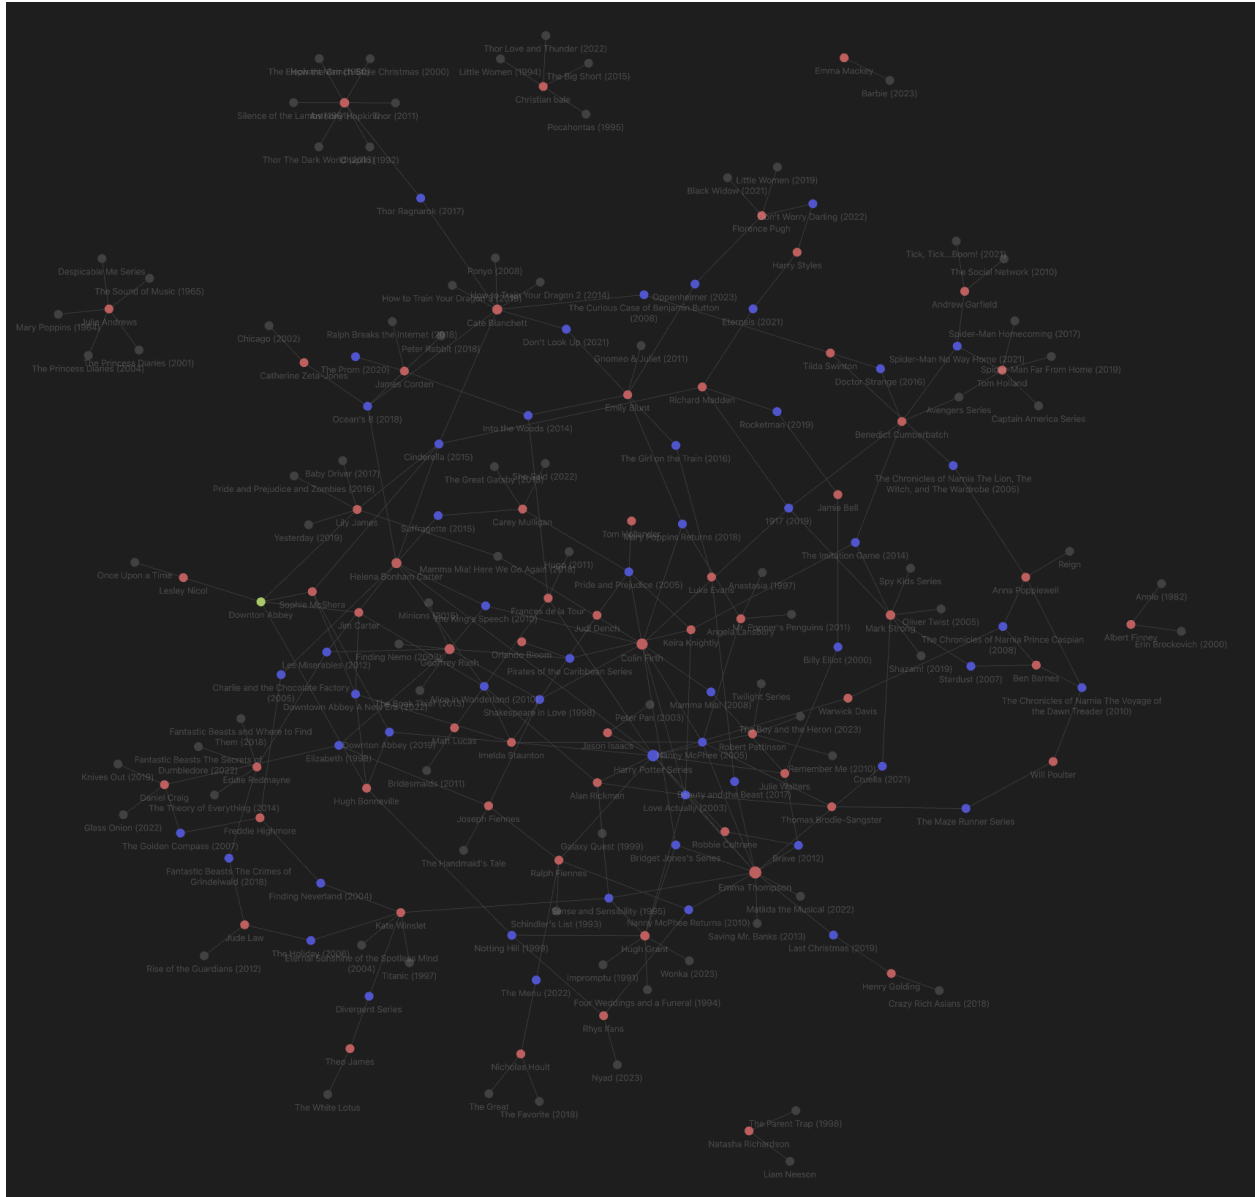

two red dots could either be a marriage, sibling, or parent relationship. I used yellow nodes for directors and pink nodes for composers.

The size of the node for blue or white nodes directly correlates to how many famous actors appear in them. The size of a red, white, or pink node represents the amount of movies they have worked on.

One of my favorite actresses is Emma Thompson, and she has one of the largest nodes in my graph. When I hover over her node, it shows the list of films she has appeared in.

I started to wonder about the UK actors (including from Wales, Scotland, and Northern Ireland). So I created a subgraph which is shown below.

The red nodes still represent actors. However, the main difference in this graph is that the blue nodes are only films that have at least 2 edges while the gray nodes are films that have only 1 edge. When I see Julie Andrews' node (in the top left corner), I can see that she shares an edge with 5 gray nodes. This immediately tells me that I have not seen her in a film with another British, Welsh, Scottish, or Northern Irish actor.
